

MECH230 - Fall 2024

Recommended Problems - Set 08

Theresa Honein

October 1, 2024

The problems are taken from J. L. Meriam, L. G. Kraige, and J. N. Bolton (MKB), Engineering Mechanics: Dynamics, Ninth Edition, Wiley, New York, 2018.

1. [MKB 03-028] During its motion, the only force acting on the spacecraft is the gravitational force

$$\mathbf{F} = G \frac{M_e m}{(R_e + h)^2} (-\mathbf{e}_r),$$

where the origin is taken at point O . This force is conservative with potential energy

$$U = -\frac{GM_e m}{r}.$$

Hence, all the forces doing work on the satellite are conservative, so the energy of the spacecraft is conserved. Use the conservation of energy to solve this problem. Refer to table D/2 copied at the end of this booklet for the necessary numerical values.

3/128 Upon its return voyage from a space mission, the spacecraft has a velocity of 24 000 km/h at point A , which is 7000 km from the center of the earth. Determine the velocity of the spacecraft when it reaches point B , which is 6500 km from the center of the earth. The trajectory between these two points is outside the effect of the earth's atmosphere.

PROBLEM 3/128

2. [MKB 03-080]

3/80 The 2-kg collar is at rest in position *A* when the constant force *P* is applied as shown. Determine the speed of the collar as it passes position *B* if (a) $P = 25$ N and (b) $P = 40$ N. The curved rod lies in a vertical plane, and friction is negligible.

PROBLEM 3/80

3. [MKB 03-084]

3/84 The 2-kg collar is released from rest at *A* and slides down the inclined fixed rod in the vertical plane. The coefficient of kinetic friction is 0.40. Calculate (a) the velocity *v* of the collar as it strikes the spring and (b) the maximum deflection *x* of the spring.

PROBLEM 3/84

4. [03-094]

3/94 The collar of mass m is released from rest while in position A and subsequently travels with negligible friction along the vertical-plane circular guide. Determine the normal force (magnitude and direction) exerted by the guide on the collar (*a*) just before the collar passes point B , (*b*) just after the collar passes point B (i.e., the collar is now on the curved portion of the guide), (*c*) as the collar passes point C , and (*d*) just before the collar passes point D . Use the values $m = 0.4 \text{ kg}$, $R = 1.2 \text{ m}$, and $k = 200 \text{ N/m}$. The unstretched length of the spring is $0.8R$.

PROBLEM 3/94

5. [03-101]

3/101 The small slider of mass m is released from rest while in position A and then slides along the vertical-plane track. The track is smooth from A to D and rough (coefficient of kinetic friction μ_k) from point D on. Determine (*a*) the normal force N_B exerted by the track on the slider just after it passes point B , (*b*) the normal force N_C exerted by the track on the slider as it passes the bottom point C , and (*c*) the distance s traveled along the incline past point D before the slider stops.

PROBLEM 3/101

3/263 The simple 2-kg pendulum is released from rest in the horizontal position. As it reaches the bottom position, the cord wraps around the smooth fixed pin at *B* and continues in the smaller arc in the vertical plane. Calculate the magnitude of the force *R* supported by the pin at *B* when the pendulum passes the position $\theta = 30^\circ$.

PROBLEM 3/263

TABLE D/2 Solar System Constants

Universal gravitational constant	$G = 6.673(10^{-11}) \text{ m}^3/(\text{kg} \cdot \text{s}^2)$ $= 3.439(10^{-8}) \text{ ft}^4/(\text{lb} \cdot \text{sec}^4)$
Mass of Earth	$m_e = 5.976(10^{24}) \text{ kg}$ $= 4.095(10^{23}) \text{ lb} \cdot \text{sec}^2/\text{ft}$
Period of Earth's rotation (1 sidereal day)	$= 23 \text{ h } 56 \text{ min } 4 \text{ s}$ $= 23.9344 \text{ h}$
Angular velocity of Earth	$\omega = 0.7292(10^{-4}) \text{ rad/s}$
Mean angular velocity of Earth–Sun line	$\omega' = 0.1991(10^{-6}) \text{ rad/s}$
Mean velocity of Earth's center about Sun	$= 107\,200 \text{ km/h}$ $= 66,610 \text{ mi/hr}$

Body	Mean Distance to Sun km (mi)	Eccentricity of Orbit <i>e</i>	Period of Orbit solar days	Mean Diameter km (mi)	Mass Relative to Earth	Surface Gravitational Acceleration m/s ² (ft/sec ²)	Escape Velocity km/s (mi/sec)
Sun	—	—	—	1 392 000 (865 000)	333 000	274 (898)	616 (383)
Moon	384 398 ¹ (238 854) ¹	0.055	27.32	3 476 (2 160)	0.0123	1.62 (5.32)	2.37 (1.47)
